
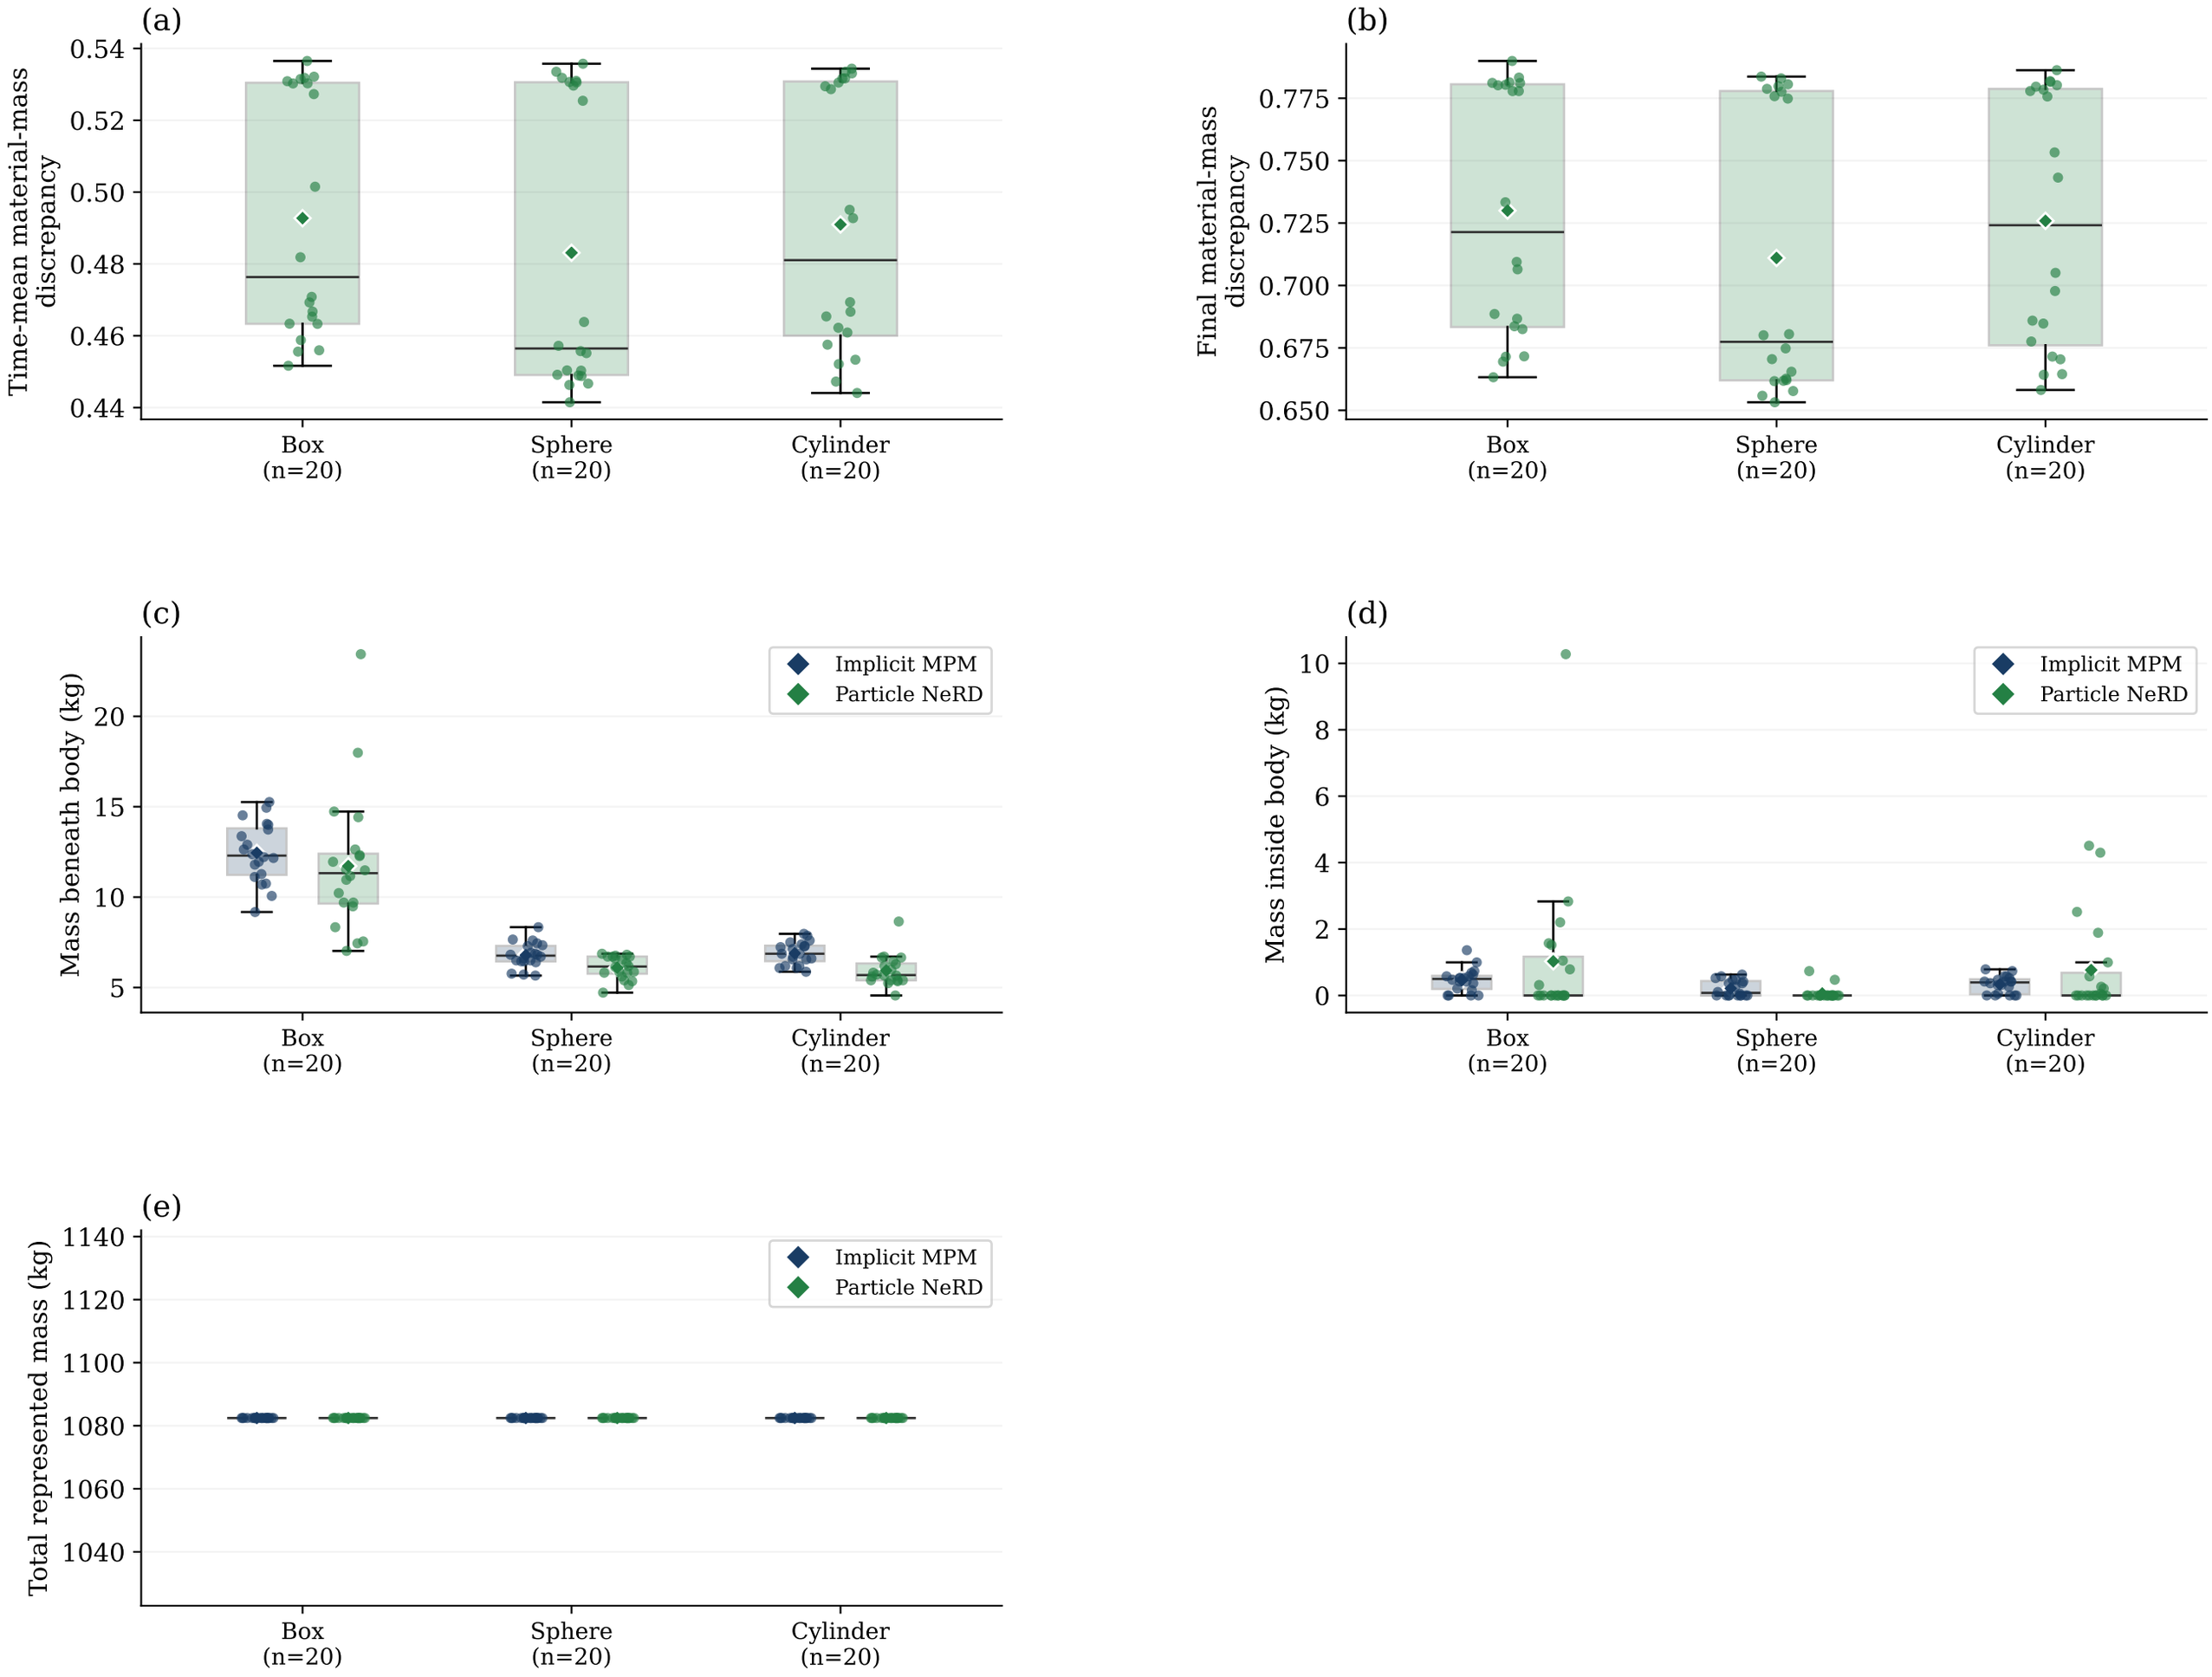

Figure 4: Frozen object-model checkpoint 9,000. (a,b) Time-mean and final grid-mass discrepancy: sum of absolute cell-mass differences divided by total physical mass. (c,d) Final physical mass beneath and inside the body; (e) total represented mass at 6 s. Equal total mass does not imply correct distribution or confinement to the tray. Each dot is one trajectory summary; boxes show the median and interquartile range, whiskers extend to 1.5 IQR, diamonds mark means. Twenty trajectories per shape unless labeled otherwise. Time means use available samples; empty particle regions are not assigned zero error.
